It's actually a.Evaluation of craniofacial morphology in various stages of human pregnancy using three-dimensional ultrasonographic imaging techniques. To date, little is known about the craniofacial development, particularly pregnancy related, in the human fetus. A specific method for the examination of craniofacial morphology has been lacking. The purpose of this study was to examine craniofacial morphology in various stages of human pregnancy using three-dimensional (3-D) ultrasonographic techniques, which can easily display craniofacial structures with 3-D modeling, and to compare our results with those reported in the literature. We used two ultrasonographic techniques, ultrasonogram in the coronal plane (transverse ultrasonogram) and real-time ultrasound in the sagittal plane (mixed axial and coronal ultrasonogram), to assess this. Thirty-three pregnant women who planned to deliver their fetuses at our clinic were selected for the study, and seven fetuses at different stages of pregnancy were examined. The fetal craniofacial morphology was assessed using the 3-D ultrasonographic techniques. The fetuses were classified into three groups based on gestational age. The results indicated that the craniofacial morphology changed significantly during the different stages of pregnancy. The craniofacial dimensions of the fetuses changed during the gestational weeks. The length of the craniofacial structures increased significantly from the time of conception to delivery. The 3-D ultrasonographic techniques made it possible to evaluate the craniofacial morphology of the fetal head in various stages of pregnancy. This could be of help in planning and performing abortion and delivery by cesarean section.Travellers Tales Travellers Tales is a website dedicated to classical music reviews and interviews as well as news relating to the classical music industry.
